

Operators requiring covert communications have a new wireless solution with the introduction of the 'MaxIT Wireless Bluetooth® Inductive Loopset'. The Inductive loop works with covert inductive earpieces. The difference with the MaxIT solution and other products available is the link between the 2-way radio and the loop. This is commonly done with cables and can be awkward to handle and easy to detect. MaxIT offer a Bluetooth® device that connects to the I/O port on most professional 2-way radios. The radio is then linked to the loop via a wireless Bluetooth® format. The case on

the loop has a built-in mic, PTT button, power button and volume control button and a facility to connect to an external PTT and mic. The set includes a ring PTT (that can also house a microphone) for effective covert operation. The loop is powered by a sealed Ni-MH Prismic battery cell providing hours of continuous talk time. The Bluetooth® unit attached to the 2-way radio is powered by the radio itself. The MaxIT Wireless Inductive Loopset offers sound quality and a level of reliability rarely found in covert communications, especially wired sets.
